1 Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

NumberList	1
PublicTests	4
ReleaseTests	4

2 Class Documentation

2.1 NumberList Class Reference

Public Member Functions

- [NumberList](#) ()
- [NumberList](#) (int[] a)
- [NumberList](#) ([NumberList](#) original)
- int [getSize](#) ()
- int [getAt](#) (int index)
- long [getSum](#) ()
- boolean [contains](#) (int searchVal)
- int [indexOf](#) (int target)
- int [findMin](#) ()
- boolean [sameArrays](#) (int[] array1)
- void [append](#) (int newValue)
- int[] [reverse](#) ()

Public Attributes

- `int[] values`

2.1.1 Detailed Description

This class encapsulates an array of integers, called `values`.

Author

CMSC131

2.1.2 Constructor & Destructor Documentation

2.1.2.1 `NumberList ()`

Default CTOR for this class: creates `values` as an empty array.

2.1.2.2 `NumberList (int[] a)`

Given an array `a`, use its contents to initialize the contents of the internal array, `values`.

Parameters

<code>a</code>	
----------------	--

2.1.2.3 `NumberList (NumberList original)`

Copy Constructor for this class: must create a shallow-copy of `original`.

Parameters

<code>original</code>	
-----------------------	--

2.1.3 Member Function Documentation

2.1.3.1 `void append (int newValue)`

Append (add to the end) of the `values` instance variable by creating a new array large enough to hold the extra item and returning it.

Parameters

<code>newValue</code>	
-----------------------	--

2.1.3.2 `boolean contains (int searchVal)`

Returns true if `searchVal` is found in `values` (the instance variable belonging to the class).

Parameters

<i>searchVal</i>	
------------------	--

Returns

2.1.3.3 int findMin ()

Returns the index of the smallest integer in `values`. Precondition: `values` is not empty. Note, this method returns the index of the "first" occurrence of the smallest element in the array. For example: suppose `values` = [9, 2, 3, 2] then `findMin` returns 1, because this is the index of the smallest element first encountered scanning the array from left to right.

Parameters

<i>newValue</i>	
-----------------	--

2.1.3.4 int getAt (int index)

Returns the value found at `index`, or throws a new `IndexOutOfBoundsException` if the `index` is bad.

Parameters

<i>index</i>	
--------------	--

Returns

2.1.3.5 int getSize ()

Returns the size of the instance variable, `values`

Returns

2.1.3.6 long getSum ()

Returns the sum (as a `double` number of the values found in the `values` array. Note: returns 0 if `values` is empty.

Returns

2.1.3.7 int indexOf (int target)

Returns the index of the first (searching from left to right) target (an `int`) in the `values` array; returns -1 if the target is not found in the array.

Parameters

<i>newValue</i>	
-----------------	--

2.1.3.8 int [] reverse ()

Returns a copy of `values` but with its contents reversed. As a precondition, assumes that `values` is non-empty.

2.1.3.9 boolean sameArrays (int[] array1)

Returns true only when `array1` has the same elements as `values` element for element.

Parameters

<i>array1</i>	
<i>array2</i>	

Returns**2.1.4 Member Data Documentation****2.1.4.1 int [] values**

The instance variable: `values`

Referenced by `NumberList()`.

The documentation for this class was generated from the following file:
